

Data Analytics Process

Bandi chakradhar

Any data analytics process can roughly be categorized to six steps.

We will explain these steps with real life examples. Here we take an example of Going to store to buy things for home.

1. Plan

It's the process of deciding what to buy from the store that are actually needed to home like provisions, utensils, daily necessities, vegetables, fruits, dry fruits etc.

2. Preparing

We start preparing the list of items we need and the amount required for buying those items and also we will prepare what items are mandatory and what items are optional.

3. Process

Here, I need to check what exactly needed to us like, if we want dry fruits then we will have various options like almonds, chashews, walnuts, pumpkin seeds etc. So, we need to process in the way that what is exactly required to us.

4. Analyze

Now, we need to analyze by choosing the right company of the product and the quality and quantity we are getting for that product.

5. Share

Now, we share our entire list of products to the shopkeeper to know if there is an offer on any products for billing.

6. Act

Finally we buy the products from the store.
